Learning Journey

- For this course I've gone through a series of classes that taught me more about AI applications and roles in a multitude of sectors and industries.
- During my time writing case studies I also got to learn about common benefits, risks, and societal implications when using AI in general.

Key Projects

- While most of my journey was discovering and documenting case studies of AI applications. There are two projects that I'd like to highlight:
- Waste Detection Proposal – A proposal I made in Case Study A11 where I propose a computer vision model that identifies scrap material that can be reused instead of being discarded.
- Sofa Manufacturer – Despite its name, it's a computer vision model that identifies the qualities of the materials used for the fabric, and frame of the sofa.

Real World Applications

- The sofa project and the recycling proposal are two applications that can be used in the real world to potentially benefit the two work environments that they are aiming for.
- Though I want to tackle just manufacturing industries. Since that is the one I am most interested in. Both in terms of college, and my personal interest.

Reflection & Next Steps

- Overall, I'd say that I had a meaningful learning experience throughout this course. And I really liked all the projects that I got to do.
- As for the future though, I do plan on revisiting and upgrading the computer vision model that identifies the quality of sofa components.
- However, I'm still up for other future projects.
