

News about Claude being banned by Anthropic, Amazon was taken down by an AI coding bot. Tensions between the Pentagon and AI giant Anthropic reached a boiling point. Then after that, we talked about AI applications in agriculture and healthcare. After the break, when talking about agriculture we talked about stuff like the impact of climate change, debatable topics like GMOs, and the current political and government status regarding those agricultural topics.

Some applications for agriculture that I could find are AI-powered drones for crop monitoring, machine learning for yield prediction, smart irrigation systems based on soil data, and computer vision for pest/disease detection. Meanwhile applications for healthcare that I could find are predictive analytics for patient monitoring, robotic-assisted surgery, personalized medicine, and virtual assistants for triage.
